THE HILL COUNTRY CEDAR REMOVAL GUIDE

Why Ashe juniper is quietly costing you water, grass, and property value — the removal methods compared, how to stop the regrowth, and what your land gives back.

»»» A FREE GUIDE FROM 9 ARROW LAND SERVICE

WHAT CEDAR IS COSTING YOUR LAND

"Cedar" — really Ashe juniper — is part of the Hill Country. In small amounts it's fine. In thick stands it quietly works against you: it drinks water that native grasses and springs need, shades out the grass your livestock and wildlife depend on, and stacks up as ladder fuel that carries wildfire into the canopy.

- » **Water.** Researchers estimate a large Ashe juniper can use tens of gallons of water on a hot day — water that never reaches your grass, stock tanks, or springs.
- » **Grass.** Dense cedar shades and out-competes native grasses, shrinking grazing and ground cover.
- » **Fire.** Cedar is oily and burns hot. Thick stands near structures are a serious wildfire risk.
- » **Health & access.** Cedar fever in winter, plus thickets you simply can't walk or work through.

REMOVAL METHODS COMPARED

METHOD	HOW IT WORKS & TRADE-OFFS
Forestry mulching	Grinds cedar in place into mulch. Best for density. No burning, no haul-off, leaves erosion cover. Our go-to.
Hand-cutting	Chainsaw crews, tree by tree. Precise for selective work; slow and costly at scale.
Dozer / grubbing	Pushes and uproots. Aggressive but disturbs soil and invites erosion and regrowth.
Burning	Cheap in theory, but permit-heavy, weather-dependent, and risky during Texas burn bans.

DENSE ASHE JUNIPER ON A HILL COUNTRY TRACT

HOW TO STOP THE REGROWTH

THE KEY FACT

Here's the good news: unlike mesquite, Ashe juniper does not re-sprout from the stump — if it's cut or mulched below its lowest green branch. Done right, the cedar you remove is gone for good. The only follow-up is catching new seedlings.

- ☐ **Mulch low.** Take cedar below the lowest live branch so it can't come back.
- ☐ **Protect the keepers.** Flag heritage oaks and shade trees before any work starts.
- ☐ **Plan a follow-up pass.** Check for seedlings at 12–24 months and knock them down early.
- ☐ **Let the grass return.** Once the cedar's gone, native grasses and ground cover fill in — often on their own.

WHAT YOUR LAND GIVES BACK

Clearing thick cedar is one of the highest-return improvements you can make to Hill Country land:

- »» **More water in the ground** — recovering grass, springs, and stock tanks.
- »» **Real grazing and wildlife habitat** where there was only shade and needles.
- »» **Defensible space** that lowers your wildfire risk.
- »» **Open, walkable, sellable land** — and often a stronger case for an ag valuation.

CEDAR MULCHED IN PLACE — HILL COUNTRY RANCH

READY WHEN YOU ARE.

Tell us about your property and we'll walk the land with you — no pressure, no percentage-of-spend games. You'll know the cost before we start.

- ✓ Free, walk-the-land estimate
- ✓ Insured · pro-grade CAT 275 & Weiler M860A equipment
- ✓ Fine, finished mulch — not chunks and ruts
